Fire Protection in Hidden Areas

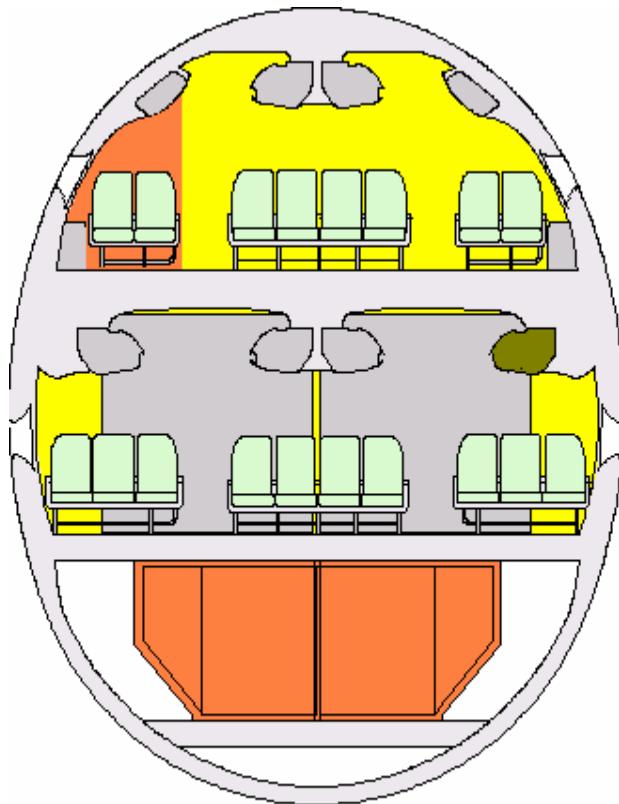

International Aircraft Systems Fire Protection Working Group
Meeting in Atlantic City on November 5-6th, 2003

Fire Protection Pressurized Area

- **Hidden Areas Fire Protection is addressed by**
 - ▶ International Aircraft **Materials** Fire Test Working Group
 - ▶ International Aircraft **Systems** Fire Protection Working Group
 - ▶ Other bodies (not leaded by an airworthiness authority)
- **Efficient Fire Protection is an overall approach and requires dedicated to type solutions**
 - ▶ **Passive** protection (materials & construction)
 - ▶ **Active** protection system (detection & extinguishing)

Fire Protection Pressurized Area

Be sensitive to potential fire hazards

- Envisage the areas
- Design areas correspondingly
- Optimize passive fire protection
- Combine passive & active protection

Demonstrate that a fire hazard is not hidden

⇒ **Avoid additional detection systems where not absolutely needed**

Fire Protection Pressurized Area

- **Hidden areas maybe**
 - ▶ on main deck
 - Above ceilings, behind side panels, below cabin floor, stowage compartments, overhead bins
 - ▶ on lower deck
 - Above ceilings, behind side panels, below cargo hold floor, dedicated compartments, equipment bays
 - ▶ between decks

- **Hidden areas require dedicated attention**
 - ▶ Fire loads need to be minimized within inaccessible areas
 - ▶ Materials and construction must provide sufficient level of fire proofness
 - ▶ Systems & Installations must not produce a fire hazard
(failure conditions to be envisaged)
 - ▶

Demonstrate

- that you have considered the critical scenario
- that the fire hazard is not hidden

Fire Protection Pressurized Area – Overhead Bin

The overhead bin has to include features

- to allow early detection of a fire by cabin crew
- to avoid installation of fire detectors

Fire Protection Pressurized Area – Equipment Bay

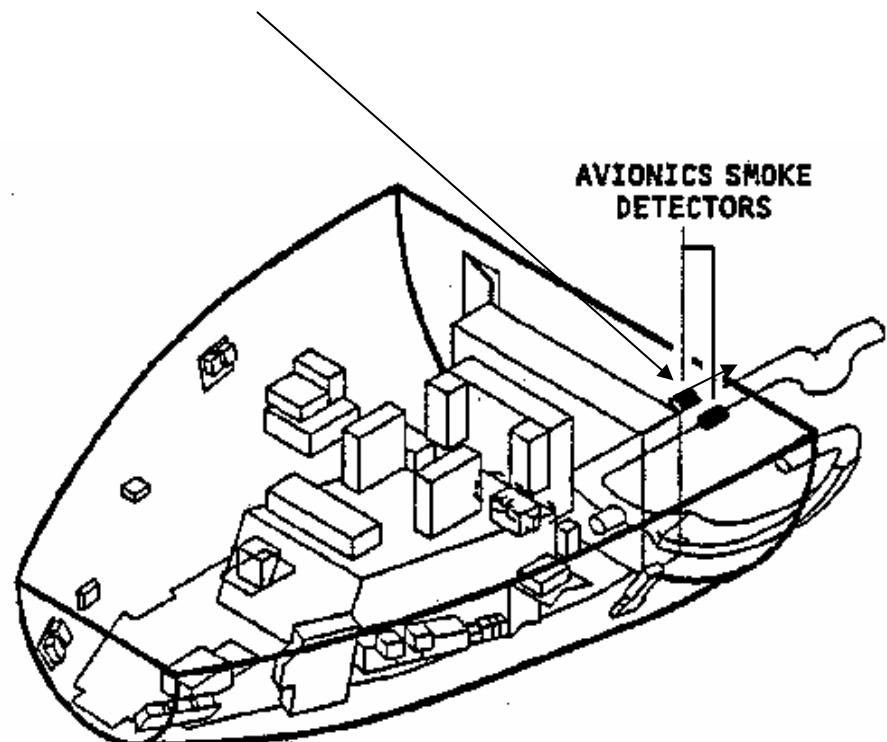

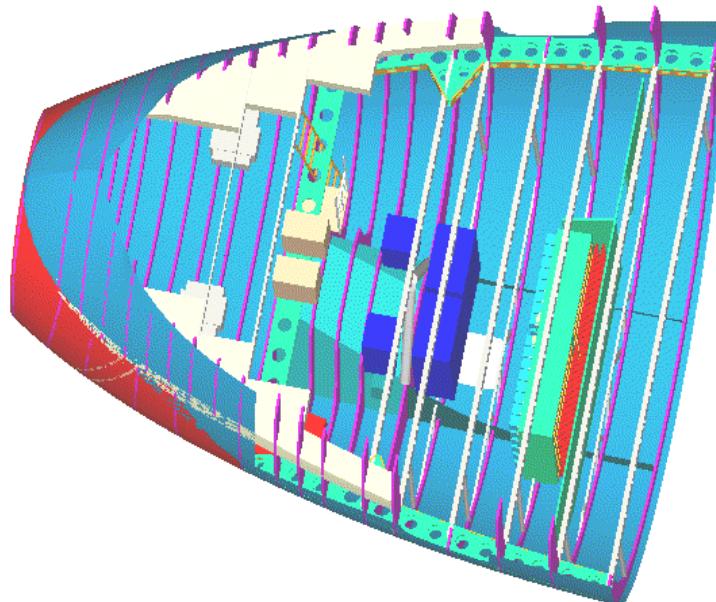

The equipment bay has to include features to

- allow detection of a fire
- get access to the fire source if required by procedure

Fire Protection Pressurized Area - Active Protection – Avionics Bay

Extracted air is monitored by smoke detectors

Fire Protection Pressurized Area - Passive Protection – behind cabin linings

Segregation between systems

Fire Protection Pressurized Area - Active Protection – Lower Deck Facilities

Staircase to lower deck facilities (Toilets & Stowage)

Fire Protection Pressurized Area - Active Protection – Crew Rest Area

Introduce efficient solutions
combine passive & active means

Fire Protection Pressurized Area - Active Protection – In Flight Entertainment Rack in Cargo Bay

Smoke detectors are monitoring
the extracted air

Fire Protection Pressurized Area - Active Protection – Lower Deck Movable Crew Rest

Conclusion

- **Efficient Fire Protection is an overall approach**
 - ▶ Fire prevention (design & operations)
 - ▶ **Passive** protection (materials & construction)
 - ▶ **Active** protection system (detection & extinguishing)
- **Design directives**
 - ▶ Provide guidelines for **material** selection & construction
 - ▶ Provide requirements for **system** installations (segregation)
 - ▶ Need to be considered if updates have to be installed
 - ▶
