

**John Harris** is currently a senior specialist scientist with The Boeing Company. He develops materials and coatings with improved flammability properties for airplane interiors and systems. His initial work at Boeing was focused on the design and development of a luminescent coating system that is used to record the distribution of pressure across wind tunnel models. Some of his later work included the development of fire-safe wraps and coating systems for Boeing Commercial Airplane programs. He is currently evaluating the impact of aging upon the flammability properties of selected thermoplastic films. He earned a PhD in Analytical Chemistry from the University of Washington in 1998.
