

# Crashworthiness Research Programs at the FAA

**Federal Aviation  
Administration**

## **Fokker F28**

Presented to: FAA Fire and Cabin Safety

By: Joseph Pelletiere, Chief Scientific  
and Technical Advisor for Crash  
Dynamics, FAA

Date: October 2019

# Overview

- **Previous experience**
- **Background**
- **Current test programs – NASA Collaboration**
  - Fokker F28
    - 2 Barrel drops
    - Seat sled tests
    - Full scale test

# Drop Test of ATR 42 - Video

# Drop Test of Shorts 3-30 - Video

# Rulemaking Background

- **No Airframe level crashworthiness requirement**
- **Occupant protection covered under 14 CFR 2X.562**
  - Which assumes acceptable airframe crashworthiness
- **Aviation Rulemaking Advisory Committee tasked to make recommendations for regulations and guidance Crashworthiness and Ditching**

# Survivable Crash Events

July 2013 – Asiana Flt 214  
(777 - 3 fatal, 49 of 187 serious inj/307)

January 2008 – BA Flt 38  
(777 – no fatal, 1 of 47 serious inj/152)

June 1999 – AA Flt 1420  
(DC-9 – 11 fatal, 110 injured/145)

February 2009 – TK Flt 1951  
(737 – 9 fatal, 86 inj/135)

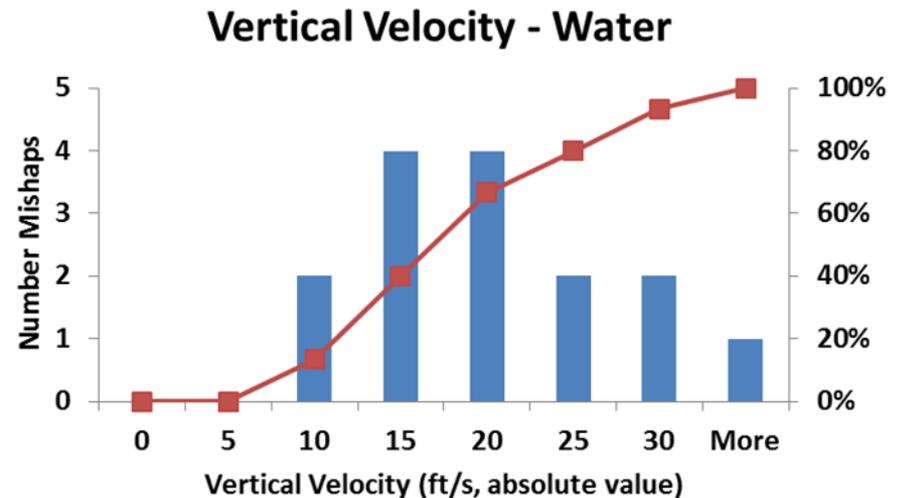

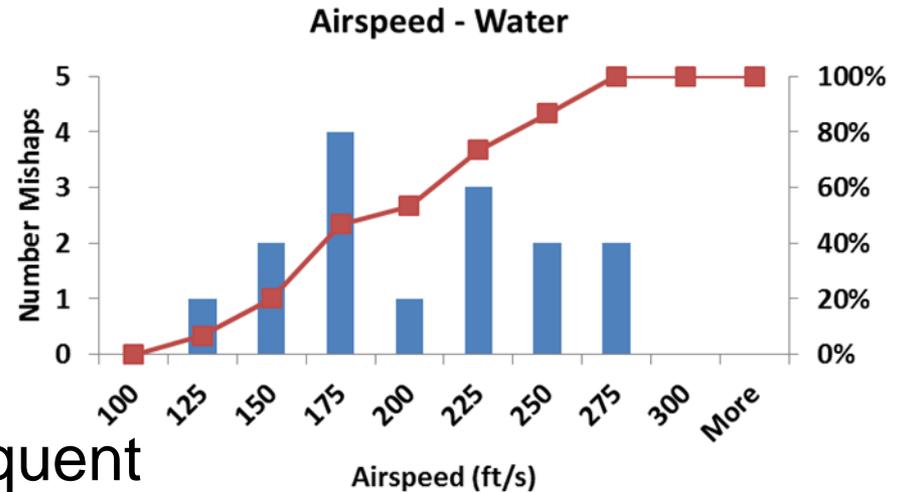

# Ditching History

Ditching Scenario (22 Mishaps studied in detail)	Percent
Planned Ditch With Power (A)	14
Planned Ditch Without Power (B)	32
Landing Short in Water (C)	23
Level Flight into Water After Takeoff (D)	5
Runway Overrun (E)	27

- Landing without power very frequent
- Distance from shore very close

Distance of Impact From the Shore	Distance (miles)
Average	3.3
Median	0.4
Greatest	30.0
Least	0.0 (shoreline)

## •Scenarios A-C

# Crashworthiness Certification Today

- **Applies to novel or unusual designs**
- **Certain recent transport airplanes have had special conditions**
  - Maintain survivable volume
  - Maintain occupant loads
  - Retention of items of mass
  - Maintain egress paths
- **Assessment is comparative to existing airplane designs**

# Objective of Rulemaking

- **Maintain** the crashworthiness and ditching level of safety already achieved by most airplanes designed using traditional metallic skin-stringer-frame construction to:
  - Accommodate new technology
    - New materials (e.g., non-metallics, hybrids, etc.)
    - New structural configurations (e.g., multiple decks, blended wing, honey comb, external fuel tanks, etc.)
    - Replace existing special conditions: ensure crashworthiness protection is equivalent to that provided by traditionally-configured airplanes, however address open issues
  - Update regulations and address unplanned ditching and inadvertent water impact events
    - Existing ditching rules are obsolete based on FAA, TCCA, UK CAA research findings over the past 30 years
    - Need to ensure that assumed ditching conditions are consistent with airplane performance

# ARAC Tasking – Crashworthiness and Ditching

Develop recommendations for **Airframe-level crashworthiness and ditching standards and advisory material** for Title 14, Code of Federal Regulations (14 CFR) part 25

- Evaluate and recommend updates to existing regulations and associated regulatory guidance
- Provide recommendations for new standards and advisory material
- Estimate costs/benefits

# ARAC Status

- Report was approved by the ARAC on September 20, 2018
- FAA has accepted the Recommendations
- FAA is considering how best to utilize the recommendations

# Collaboration with NASA

- Investigate comparison of barrel tests with full scale tests
- Compare test results with analytical results
- Collect data for regional jet sized impacts – metallic baseline

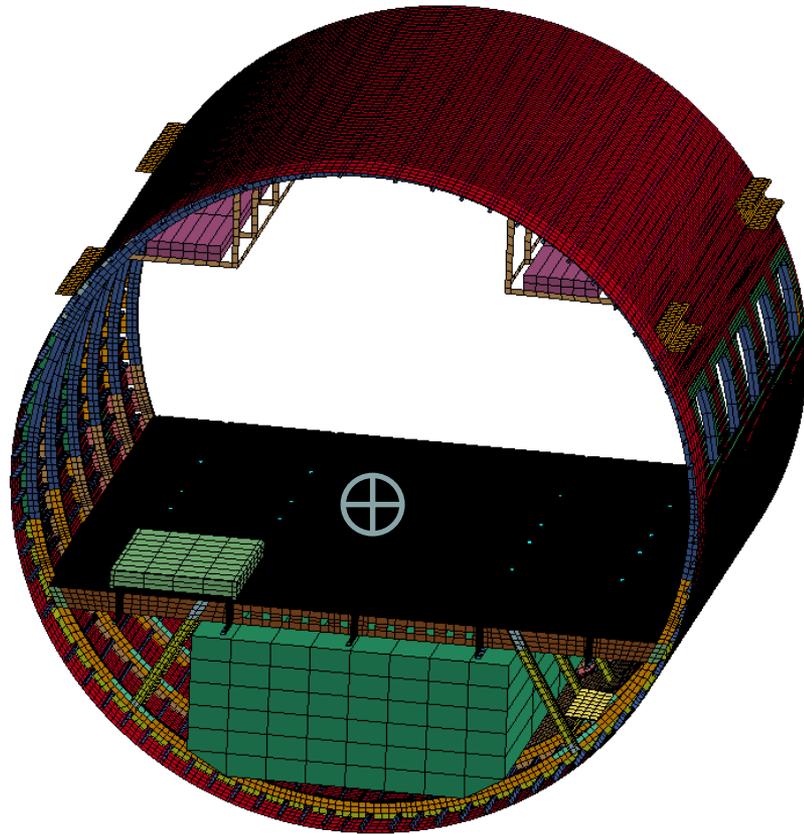

# Fokker F28 – Regional Jet Impact

- Fokker F28
  - Compare barrel drop to full aircraft
  - Compare different drop conditions
  - Compare testing with modeling and simulation

# F28 Model

- Analytical model to determine test conditions
  - Velocity
  - Surface
  - Configuration

# F28 Barrel Sections

## Forward

- **Target impact**
  - 30 ft/s vertical
  - Soil
  - Underfloor baggage

## Wingbox

- **Emergency exit door**
- **Target impact**
  - 10° sloped soil

# Seats

- Removed from service
- Modified
  - Cut down
  - Leg spacing differences

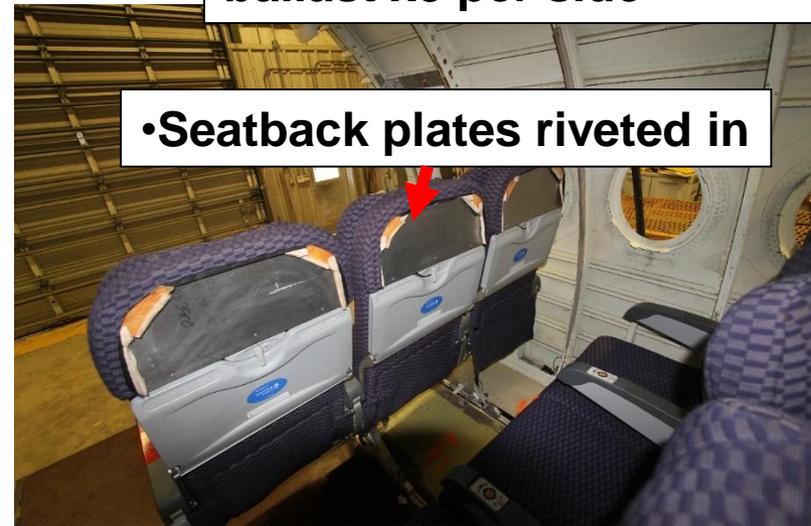

**Large Overhang**

# Buildup progress

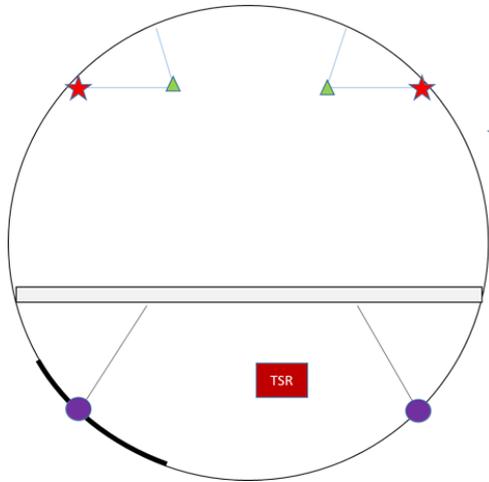

•25lb instrumented lead ballast x3 per side

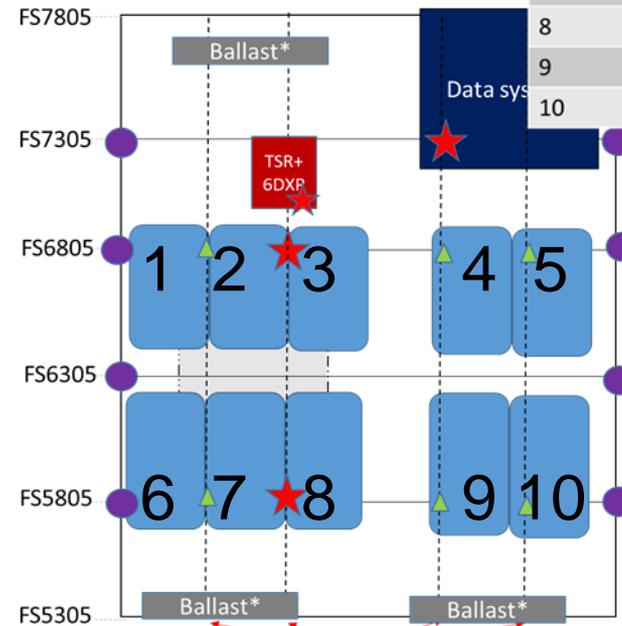

•Seatback plates riveted in

# F28 Instrumentation

- ★ x,z accelerometer on overhead bin attachments on sections 6305 and 6805
- ▲ z accelerometer on bin ballast on sections 6305 and 6805
- Z accelerometer on stanchion to barrel attachment on frames 5805 and 6805

Location	Owner	ATD
1	NASA	H3 5 <sup>th</sup>
2	NASA	H3 95 <sup>th</sup>
3	FAA	FAA H3 50 <sup>th</sup>
4	FAA	H2 50 <sup>th</sup>

10	FAA	FAA H3 50 <sup>th</sup>

- ★ x,z accelerometer on seat track
- ▲ z accelerometer on seat track
- Z accelerometer on frame section

\*Ballast added as needed

# F28 Forward Drop Test

# F28 Wingbox Drop test

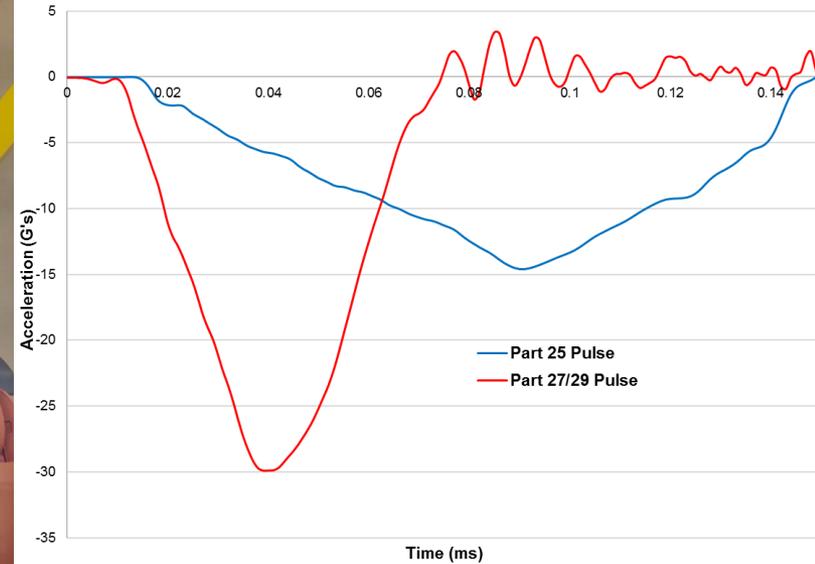

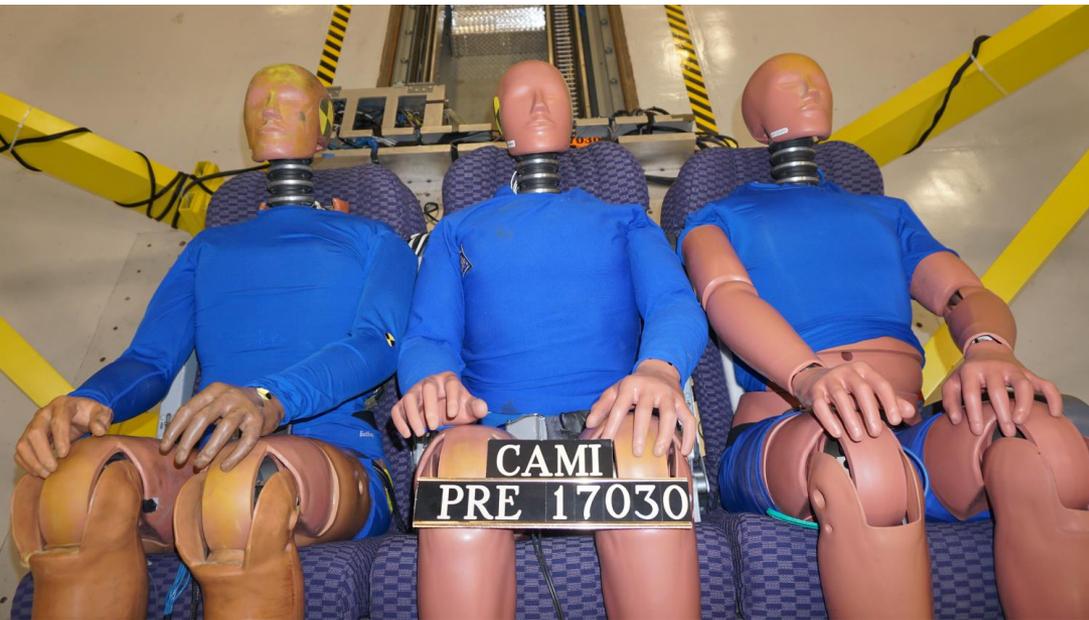

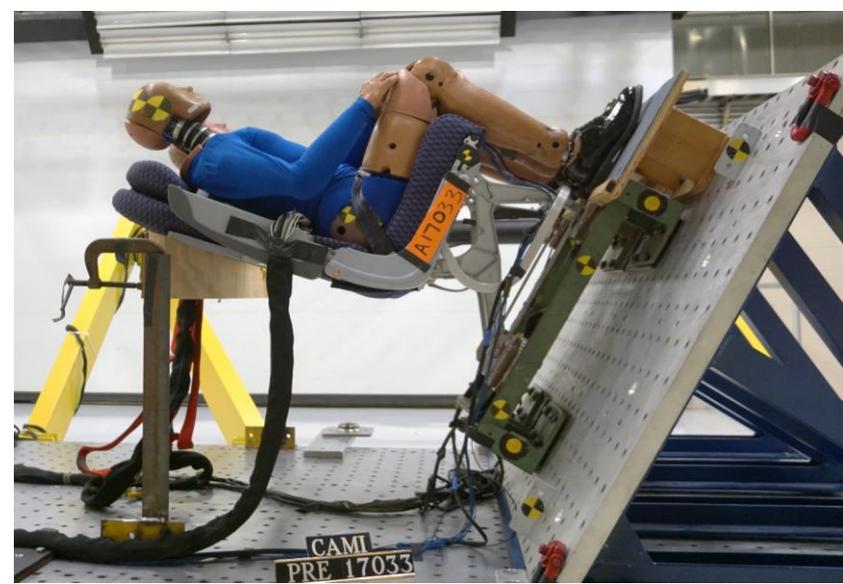

# Lab Testing

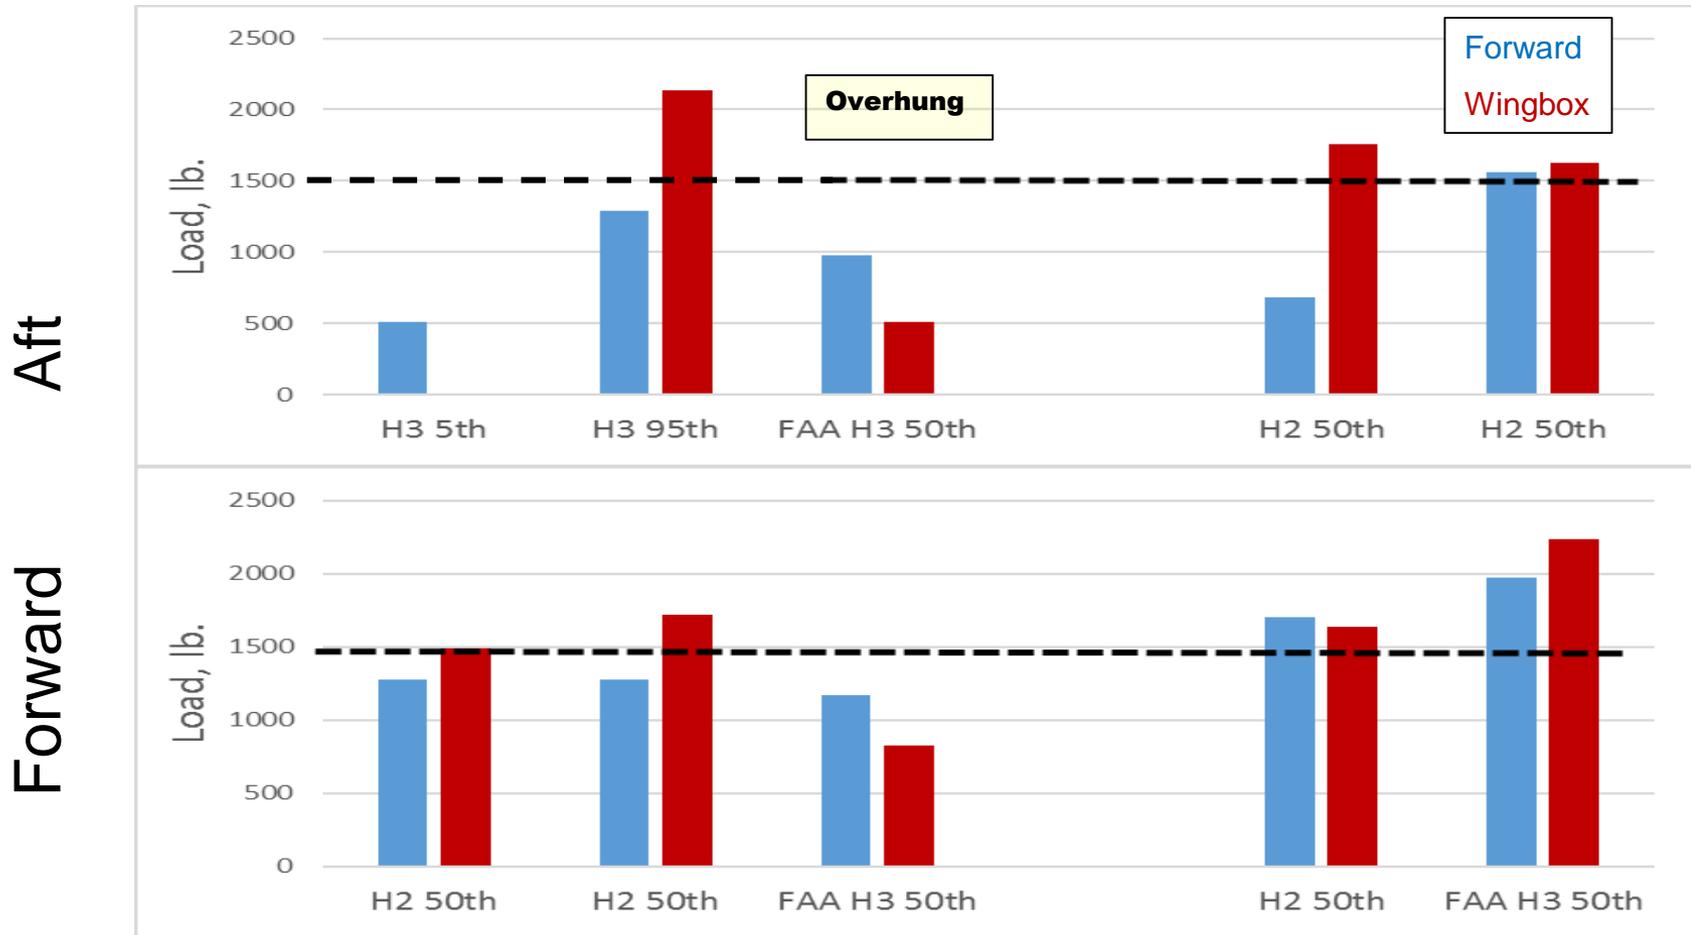

Test 1 of 14 CFR 2X.562

60° pitched up

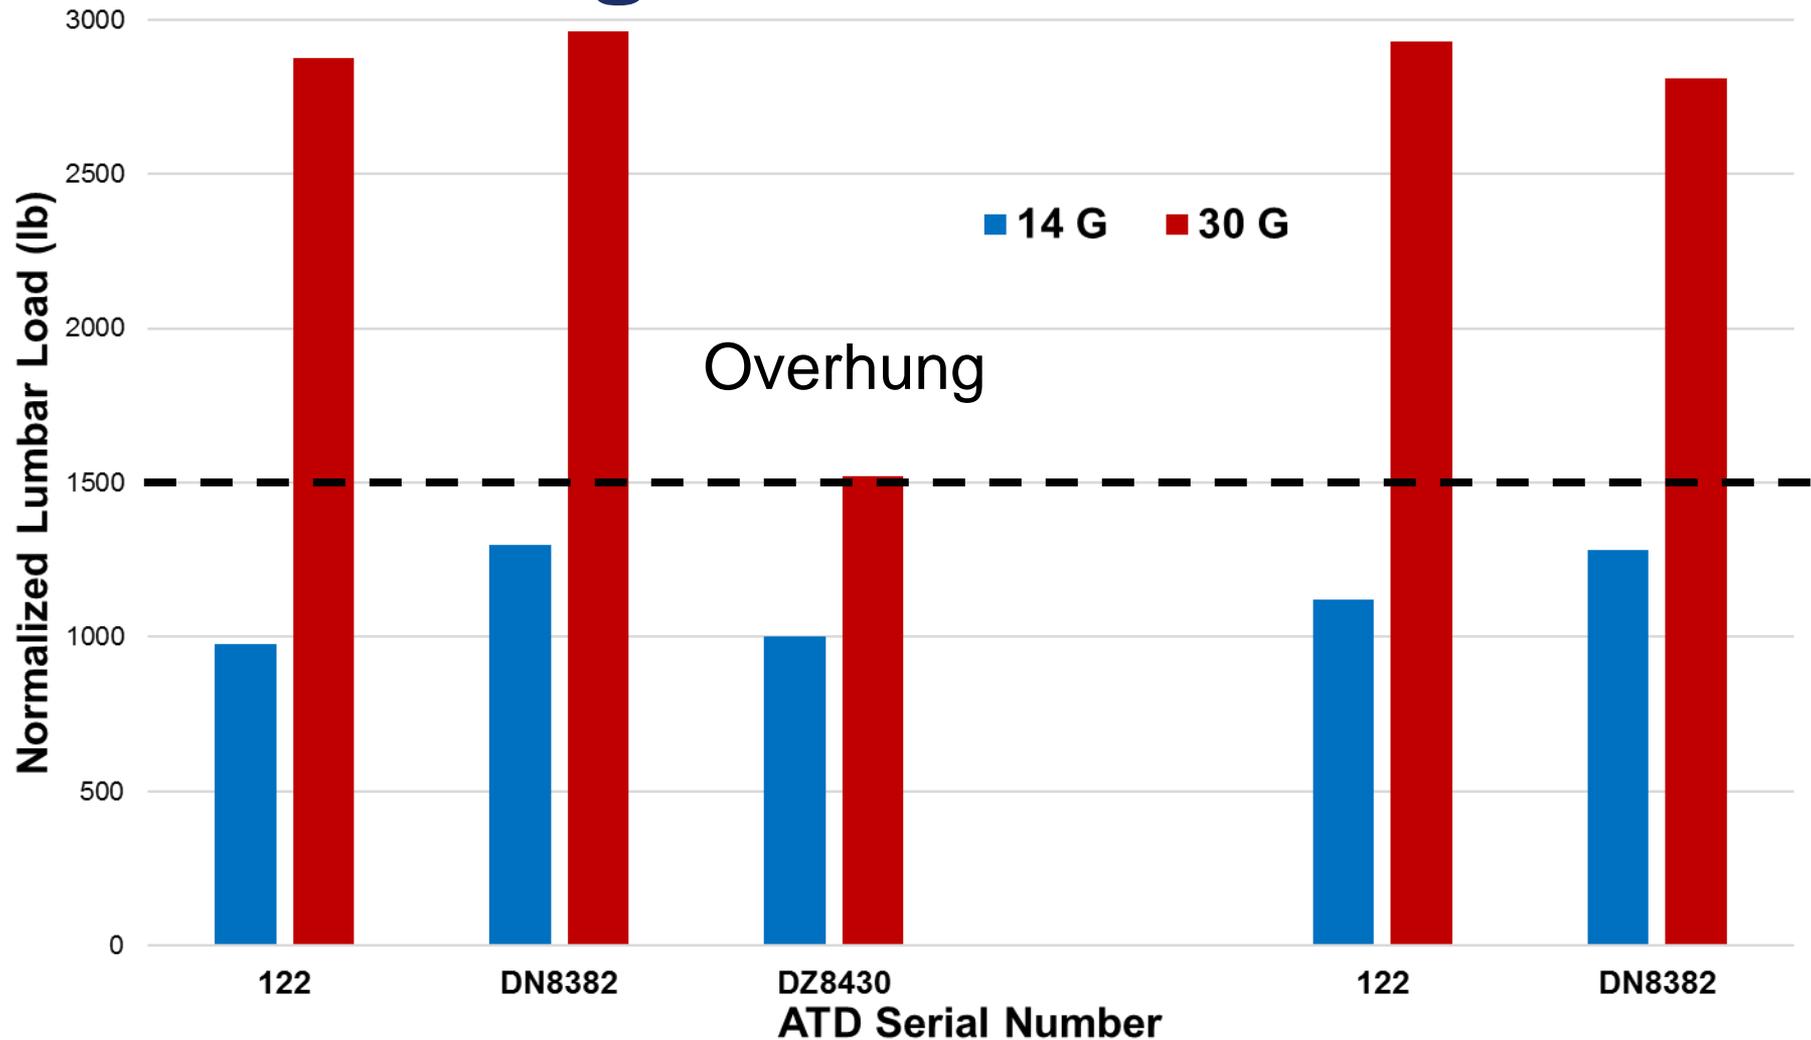

FAA Hybrid III in all positions

# Drop Test Lumbar Loading

# Lab Testing Lumbar Loads

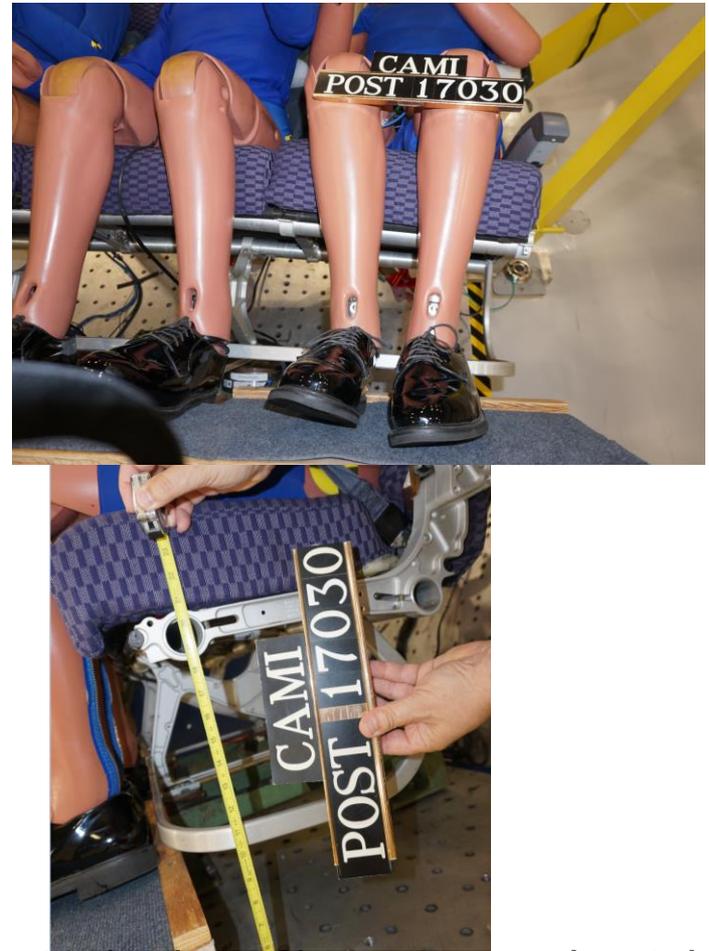

# Overhung Seat Deformation

Wingbox Drop Front Seat

Rear tube bent down approximately 5"

Lab Test

Front tube bent down approximately 2"

# Discussion

- **Overhung seat lower**
- **Brace position lower**
- **Pitch orientation delays peaks**
- **Some loads lower/higher than cert loads**
  - All seat places passed lumbar loads for lab cert type test

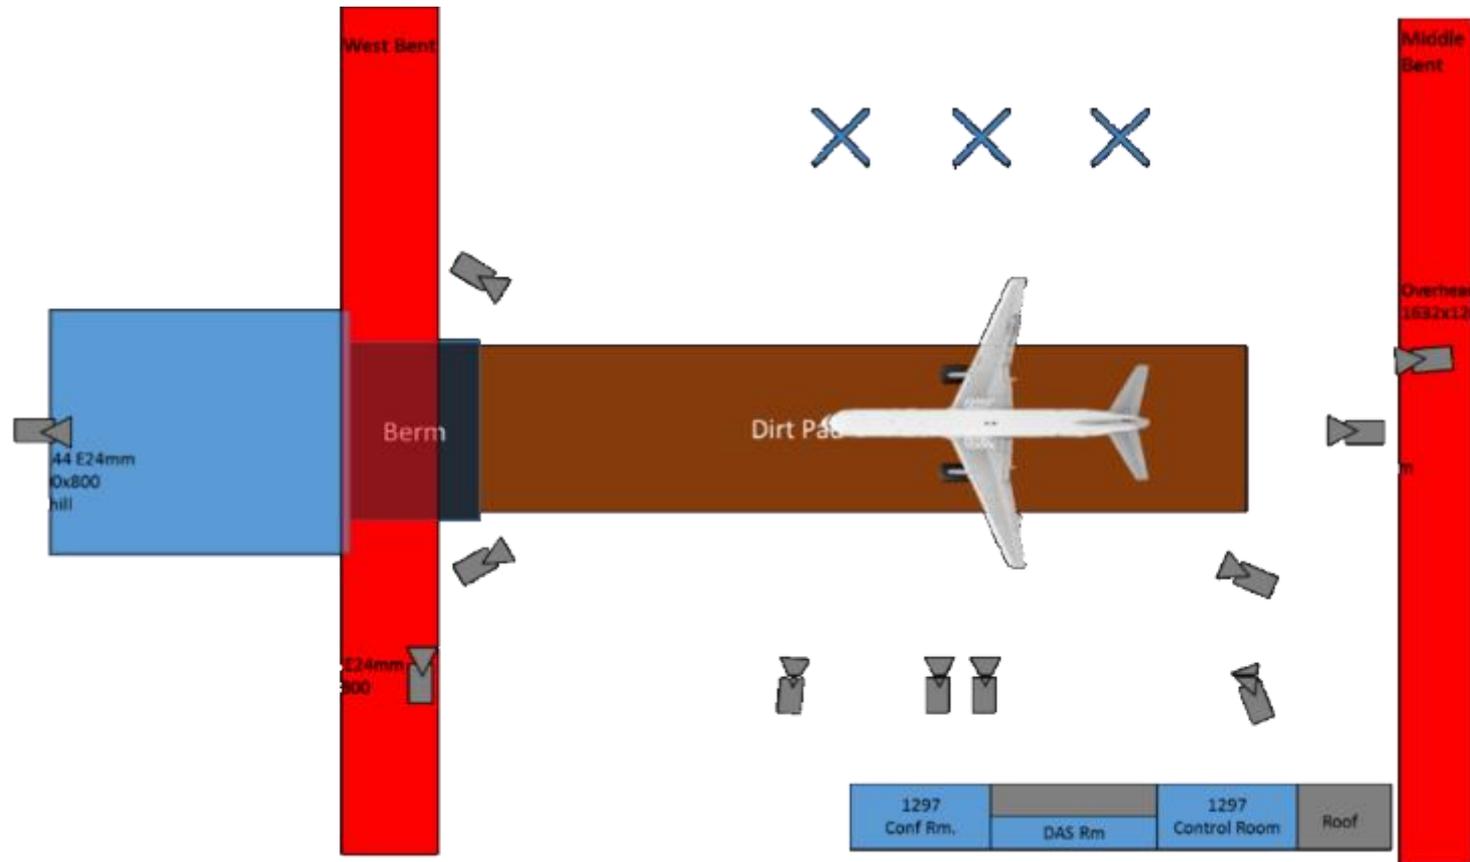

# Full Scale Test

- **Planned conditions;**
  - 70 ft/sec longitudinal
  - 30 ft/sec vertical
  - No more than 2° pitch up
  - Dirt berm

# Conclusions

- **FAA is conducting several research programs to support development of future crashworthiness guidance for transport airplanes**
- **Results will be published and made available once ready**

# Remaining Session

- **Development of a Full-Scale Finite Element Model of the Fokker F-28 Fellowship Aircraft and Crash Simulation Prediction** - Jacob Putnam for Karen Jackson (NASA)
- **Summary of Results from a Fokker F-28 Full Scale Crash Test** – Martin Annett (NASA)
- **Response from a Range of Occupants in Fokker F-28 Full Scale Crash Test** - Amanda Taylor (FAA)
- **Simulation Development and Prediction of Occupant Response in a Fokker F-28 Full Scale Crash Test** – Jacob Putnam (NASA)
