

## **[SAE A-22] Development of AS6826/4: Powerplant Fire Test Boundary Conditions**

Palmer Booth  
Gulfstream Aerospace Corporation

The SAE A-22 Committee is developing guidance to standardize the Applicant approach to boundary conditions during 5- and 15-minute powerplant fire tests. The standard outlines the rationale for the inclusion of each boundary condition and the process by which an Applicant determines appropriate boundary condition values. Group members have contributed perspectives from aircraft manufacturers, nacelle manufacturers, engine manufacturers, system component manufacturers, and test facilities. Administrator representatives have also participated in the review and critique of the draft standard.
