# LIGHTWEIGHT CFRP NITROGEN VESSELS ENABLING EFFICIENT HALON REPLACEMENT SOLUTIONS

THE TENTH TRIENNIAL INTERNATIONAL AIRCRAFT FIRE AND CABIN SAFETY RESEARCH CONFERENCE October 17-20, 2022, Atlantic City, NJ, USA

P.M. Schaefer, J.B. Philipp, K. Kirbach, M. Boettger

© Diehl Aviation

# **OVERVIEW**

- 1 Lightweight Vessels as Enabler for Nitrogen Based Halon replacement -Motivation
- 2 Introduction to Lightweight Vessels
- 3 Novel Vessel & Valve Prototyping
- 4 Conclusions

# LIGHTWEIGHT VESSELS **AS ENABLER FOR NITROGEN BASED** HALON REPLACEMENT 11111111111111111111

Contraction of the second

# BACKGROUND

#### **Green Fire Suppression Halon Replacement based on Nitrogen**

#### **Principle of Fire Suppression:**

Phase 1: "Knock-Down":

- Displacement of Oxygen by Nitrogen
- Cooling effect due to gas expansion

Phase 2: Long-term Suppression:

 Maintaining an Oxygen depleted atmosphere to prevent fire from flare up

#### Key System components:

- Nitrogen Distribution
  - Nozzles
  - Diverter und Squib Valves
  - Piping
- Nitrogen vessel
  - long term storage at > 344 bar
  - Constant pressure supply at high flow rates
  - Monitoring functions

# **MOTIVATION**

### Lightweight Storage is Key for Competitive System!

# INTRODUCTION TO LIGHTWEIGHT VESSELS

12222222222222222222222

### **FIBER REINFORCED PRESSURE VESSELS**

#### **Green Fire Suppression Halon Replacement based on Nitrogen**

Type I	Type II	Type III	Type IV
Seemless Metal without reinforcement	Metal vessel with FRP reinforcment in cylindrical part	Metal vessel fully wrapped with FRP	Non-Metal liner fully wrapped with FRP
CNG Standard	Stationary Appl.	Mobile CNG & CGH	12 storage

Pressure vessel types, based on: Rosen, P. A. : Beitrag zur Optimierung von Wasserstoffdruckbehältern; Dissertation; Springer 2018 Туре V

FRP vessel without dedicated liner

Still subject of current research projects

Vessel Type	<b>Operation Pressure [bar]</b>	Gravimetric density [weight %]		
Type III	350	4.04.2		
	700	3.53.6		
Type IV	350	5.05.5		
	700	4.85.2		

#### **Gravimetric Efficiency of <u>Hydrogen Vessels</u>**

Rosen, P. A. : Beitrag zur Optimierung von Wasserstoffdruckbehältern; Dissertation; Springer 2018

**Weight & Volume of Hydrogen Vessels**: Ahluwalia, R.K. et al.:On-board and Offboard performance of hydrogen storage options for light-duty vehicles; international journal of hydrogen energy 37 (2012) p.2891-2910

#### Fazit:

- Type IV vessels show an increased weight efficiency of ~ 25-30% compared to Type III
- Weight advantage is independent from selected operational pressure
- Polymer liner might be advantageous with respect to corrosion and fatigue behavior

# **GLANCE AT REGULATORY ASPECTS**

#### 4.2. EASA policy

Based on the above considerations, EASA has determined that composite cylinders/receptacles qualified according to the following standards would be acceptable and considered suitable for the transportation of oxygen by aircraft, or for the installation of equipment containing oxygen on aircraft:

- **1.** Any composite cylinder qualified according to ISO-11119-1 or -2 or -3 standards.
- 2. Any composite cylinder qualified according to any national or European norm, which mirrors or conforms to the international standards as in item 1 above<sup>14</sup>.
- 3. Composite cylinders holding an approval under a <u>DOT Special Permit</u>, which includes clauses permitting their usage for oxygen on aircraft, are also acceptable<sup>15</sup>.

Certification Memorandum: "Minimum qualification standards for oxygen cylinders used on board aircraft" CM-ECS-001 issue 1; 23<sup>rd</sup> May 2018

**Conclusion:** 

 EASA accepts Composite (fiber reinforced) pressuraized vessels, which are certified according to ISO 1119-1;-2;-3; this included Type III & Type IV vessels

### **NORMATIVE DESIGN PHILOSOPHIES AND IMPACT ON WEIGHT**

	1000	
Descrived Cofety for shows one would be index as don't	1600	Safety Factors for I
<ul> <li>Required Safety factors are usually independent from working pressure level</li> </ul>	1400	
<ul> <li>ISO11119_3 does not explicitly state a working pressure limit</li> </ul>	ב 1200 – מ	Dunct a
<ul> <li>Absolute safety (=material) reserve and</li> </ul>	1000 – 1000 – 1000 –	Burst
component weight increase with working pressure	Press 800 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200 – 200	Proof
	400 -	Nominal x1,5
<ul> <li>But: For permanently installed vessels (e.g. Automotive) a different philosophy for safety</li> </ul>	200 -	344 bar
factors is used → <b>Potential for significant</b> weight reduction	0 -	344 bar [DOT]

Transport vessels

### FIBER REINFORCED PRESSURE VESSELS

#### **Selection of Liner Materials**

- Permeation describes the penetration of a liquid or gas into a solid. It can be used to quantify loss of Nitrogen during service life.
- Permeation is strongly temperature dependant
- The shown examples result in a theoretical pressure loss of 5.5% over 5 years
- Design Variables to decrease permeation losses are:
  - Liner Material (Polymer)
  - Liner wall thickness
  - Additional Permeation barriers

# NOVEL VESSEL & VALVE PROTOTYPING

1222222222222222222222

### VALVE

#### **Key Characteristics**

- On Tank Valve (OTV) which is mounted on Composite Vessel
- Main Function: Providing constant Nitrogen mass flow with a defined outlet pressure range during discharge of the vessel
- Temperature & pressure monitoring of valve
- High reliability for opening of the vent due to mechanical design
- Ensuring that valve remains open after activation
- Lightweight design

# **COMPOSITE VESSEL**

- Type IV CFRP Lightweight vessel
- Volume approx. 90 litres
- Working pressure 500 bar
- Qualified according to DIN EN 12445 (similar to ISO 11119)
  - Norm for transport vessels for non oxidative gases
  - Load cycles >12.000
  - Temperatures >70°C und Temperature variation -40°C to +60°C
  - Drop from heights
  - Saltwater resistance

## **TESTING AND VALIDATION**

- Proof and Burst Pressure tests (burst >1500 bar)
- Functional testing Filling & Discharge
  - Fast discharge without ice formation
  - Specified flow rate during discharge period
  - Specified outlet pressure window
  - Leakage test after cycling

# CONCLUSIONS

### CONCLUSIONS

- First aerospace relevant prototype hardware for fire suppression systems using Nitrogen was designed, built and tested!
- Normative regulations do allow use of lightweight CFRP vessels...
- ..., but review/ adjustment of regulations could help to reduce weight significantly while maintaining same level of safety.
- Lightweight vessels and valves are key enablers for halon replacement solutions based on nitrogen and might help reduce possible weight penalties of other agents, as well!

# ACKNOWLEDGEMENT

### Parts of this work have received public funding:

This project has received funding from the Clean Sky 2 Joint Undertaking (JU) under grant agreement No 945535. The JU receives support from the European Union's Horizon 2020 research and innovation programme and the Clean Sky 2 JU members other than the Union.

Parts of the reults origin from the project BILBO, which was co-funded by the German Federal Minsitry For Digital and Transport
