AC NO: 150/5325-5B

DATE: July 30, 1975

ADVISORY CIRCULAR

DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

SUBJECT: AIRCRAFT DATA

---

1. PURPOSE. This circular presents a listing of principal aircraft weights and dimensions which affect airport facility design. It is to be used for guidance in airport development. Data presented are for common civil aircraft and those military aircraft which frequently utilize civil facilities.

2. CANCELLATION. Advisory Circular 150/5325-5A, Aircraft Data, dated January 12, 1968, is cancelled.

3. EXPLANATION OF REVISION. This revision deletes entries for rare or obsolete aircraft; introduces data for aircraft not previously included in the circular, including military aircraft; establishes new aircraft groupings which are consistent with existing airport design standards; and presents metric data.

4. HOW TO OBTAIN THIS PUBLICATION. Additional copies of this circular, AC 150/5325-5B, Aircraft Data, may be obtained free of charge from the Department of Transportation, Publications Section, TAD-443.1, Washington, D.C. 20590.

William V. Vitale

CHAPTER 1. INTRODUCTION.

1. BACKGROUND.

a. Physical characteristics of aircraft have operational and economic significance which materially affect airport design, development, and use. To insure maximum possible utilization and safety, consistent with expected demand, engineers must consider these characteristics when planning new airports or improvements to existing facilities.

b. For example, when the airport designer considers anticipated growth in air traffic, the effects of new aircraft weights and dimensions on ground operating areas must also be evaluated. The design aspects of runways, taxiways, ramps, aprons, servicing facilities, gates, and life safety facilities are directly influenced by the physical characteristics of the aircraft utilizing them.

c. Military aircraft frequently operate at civil facilities. As indicated above, the physical characteristics of these aircraft cannot be neglected when facility design is being considered. Frequent types of military operations include medical evacuation, strategic deployment and dispersal, and Reserve and National Guard training missions.

d. Among the types of military aircraft encountered at civil facilities are many which have civil variants. These are not described in Chapter 3; they are instead referenced to their counterpart(s) in Chapter 2.

2. EXPLANATORY INFORMATION.

a. In Chapter 2, Figures 2-1 to 2-4 are representative of general types of aircraft, and are not intended to portray a specific model. In all other cases the particular model is illustrated on the same page upon which its data are presented. Additionally, there are pages where data for several similar models or series of aircraft are accompanied by a single representative drawing (e.g., General Dynamics/Convair 880 and 990).

b. The following correspondence between symbols and actual dimensions is employed in all chapters, as required:

SYMBOL	DIMENSION
A	Wingspan
B	Length overall
C	Height overall
D	Wheelbase

E Nose to centerline of main gear
F Wheel track (tread)
G Centerline of fuselage to centerline of inboard engine
* H Centerline of fuselage to centerline of outboard engine *
J Outside of main gear to wingtip
* K Vertical clearance of inboard engine or propeller at maximum weight
L Vertical clearance of outboard engine or propeller at maximum weight
M Centerline of fuselage to approximate pivot point based on maximum nosewheel steering angle or locked wheels. *
N Vertical clearance of wingtip at maximum weight
P Height of exhaust of jet engine on centerline of fuselage (three-engine jet aircraft only)

* c. Turn radius is measured at maximum nosewheel steering angle or with locked wheels, whichever produces the larger radius. It is a horizontal measurement from the pivot point to the farthest point of the aircraft as it executes the turn. The dimension represents a maximum effort maneuver not normally used by the airlines because of excessive tire wear. THE DIMENSION IS NOT TO BE USED FOR FACILITY DESIGN PURPOSES. Contact the airline(s) involved for the turn radius to use for design purposes. *

d. The abbreviation "SRS" is used to denote "Series."

e. An entry of "NA" indicates data are not available.

* f. The weight and dimensional information for transport type aircraft have been extracted from aircraft manufacturer publications titled "Airplane Characteristics, Airport Planning." These publications, which are available from the manufacturers, contain considerably more information of interest to an airport designer than is assembled in this document. Publications are developed for each aircraft model (B-737,DC-9,L-1011) and are revised as necessary to incorporate model developments. Weight and dimensional data is subject to change as a result of modifications and improvements to the aircraft. The manufacturer of a particular aircraft should be contacted for data resulting from these modifications or improvements which may not yet be reflected in this circular. *

CHAPTER 2. CIVIL AND COMMERCIAL AIRCRAFT

SECTION 1. PISTON AND TURBOPROP AIRCRAFT

3. 8,000 LB. (3,628 KG.) OR LESS. Aircraft are single or light twin engine types usually capable of operating from airports developed to "Basic Utility" design criteria. The number of seats is for the standard model. The five principal configurations are:

   a. Single engine, high wing, tailwheel. (Figure 2-1)

   b. Single engine, high wing, tricycle gear. (Figure 2-2)

   c. Single engine, low wing, tricycle gear. (Figure 2-3)

   d. Twin engine, low or mid wing, tricycle gear. (Figure 2-4)

   e. Twin engine, high wing, tricycle gear. (Figures 2-5 and 2-6)

4. MORE THAN 8,000 to 12,500 LB. (3,628 TO 5,670 KG.). Aircraft are principally twin engine types capable of operating from airports developed to "General Utility" design criteria. The number of seats is for standard model. (Figure 2-7 to 2-16).

5. MORE THAN 12,500 LB. (5,670 KG.). Aircraft are twin and four engine types. Some are capable of operating from airports developed to "Basic Transport" design criteria. Others are principally operated from airports developed to "Air Carrier" design criteria. (Figures 2-17 to 2-30).

SECTION 2. TURBOJET AND TURBOFAN AIRCRAFT.

6. 60,000 LB. (27,216 KG.) OR LESS. Aircraft are twin or four engine types capable of operating from airports developed to "Basic Transport" design criteria. Most are employed as business or corporate aircraft. (Figures 2-31 to 2-40).

7. MORE THAN 60,000 LB. (27,216 KG.). Aircraft are twin, three, and four engine types principally operated from airports developed to support
* "Air Carrier" operations. (Figures 2-41 to 2-55). *

   NOTE: All weights given above are maximum takeoff weights, as used in airport design.

NOTES:
1. SRS 50, 60 HAVE TURBOFAN ENGINES. ALL OTHERS HAVE TURBOJET ENGINES.
2. MODEL 21 MAXIMUM TAKEOFF WEIGHT 276,000 LB. (125,194 KG).
   LANDING 193,000 LB. (87,545 KG).
3. MODEL 33 HAS MAXIMUM TAKEOFF WEIGHT OF 315,000 LB. (142,884 KG).
   LANDING 93,895 LB. (93,895 KG).
4. ALL SERIES 10 HAVE BEEN MODIFIED TO MODEL 21 OR 51.
