Multi Criteria Fire/Smoke Detector for Cargo Holds

Fire Protection Fuselage – Cargo Smoke Detection System

Introduction

• Cargo compt. smoke warnings require to activate the fire suppression system and to land the aircraft ASAP

• FAA investigations demonstrate that on N-registered transport aircraft (25 years period / all a/c types)
  ‣ there was a not negligible rate of false cargo smoke warnings
  ‣ there are more smoke warnings than expected diversions

• Each emergency landing comprises additive risks etc. …..

• False smoke warning are mainly caused by the freight or specific environmental conditions within the cargo holds
Background

Diversions Caused by Cargo Compartment False Smoke Alarms

Source: FAA Report
DOT/FAA/AR-TN0029
June 2000
Reason for False Warnings

- An early detection of an in-flight cargo compartment fire/smoke is mandatory to initiate the corrective action within an appropriate time.

- JAR/FAR 25.858 (a) requires: The detection system must provide a visual indication to the flight crew within one minute after the start of the fire.

- False warnings are mainly caused by the freight or specific environmental conditions within the cargo holds.

- With the 60 sec detection time requirement (FAR/JAR 25.858 (a)) the system design is always a compromise between fast detection and signal reliability.
Air Freight (Palette Loading) - Lower Deck Cargo Hold
Detection characteristics in relation to detection technology

**Algorithms**

- O = Optical channel
- T = Temp. Channel

- **Classic-Ionic**

### General Principle

The smoke density is optically measured and compared to a threshold value for status determination, the measurements can be affected by Climatic or other operational conditions.
The sensitivity of conventional smoke detectors strongly depends on the type of aerosol particles (for the same concentration).

For current systems, the smoke detectors have to be adjusted so as to early detect the fire types for which their sensitivity is the lowest; making them also more sensitive to environmental conditions.
General Principle

Aerosol density and type are evaluated, relevant environmental conditions are determined and used in a multicriteria detection logic.

Principles are specifically developed and adapted to aircraft fire and non fire situations.
Performances

- Balanced response to all type of fires.
- High immunity to fog and condensation.
- Suppression of deceptive phenomenon according to new algorithm.
- Redundant measurement
Outlook / Conclusion

The use of MultiCriteria Fire/Smoke Detectors within cargo compartments

- will enhance false alarm immunity
- could provide a more sensitive fire/smoke detection
- may need specific to type test methods on aircraft level
- requires early involvement of airworthiness authorities
- needs carefully developed & verified algorithms

Airbus has decided to use MultiCriteria Fire/Smoke Detectors in A380 cargo holds
Appendix:
- EXAMPLE 1 – OPEN WOOD FIRE

Test description: Test rig dimensions = Wide body Aircraft cargo compartment. A flaming wood fire is ignited. Alarm status of smoke detector and multi criteria fire detector are reported.

![Graph showing smoke density and alarm status over time for open wood fire tests.](image-url)
**Test description**  Composite dust is blown at the vicinity of the detectors. Alarm status of smoke detector and multi criteria fire detector are reported.

![Graph](image)

- **Smoke density (raw data)**
- **Alarm threshold = 3 %/m (conventional smoke detector)**
- **Alarm status (multi criteria smoke detector)**
- **Alarm status (conventional smoke detector)**
Appendix:
- EXAMPLE 3 – WATER VAPOR + LIQUID FIRE

**Test description**

A dense water steam is first generated at the vicinity of the detectors, after few minutes a small heptane fire (Ø pan = 30 cm) is ignited. Alarm status of smoke detector and multi criteria fire detector are reported.
